

Getting started guide

The BMJ Best Practice Comorbidities tool supports the management of the whole patient by providing guidance on the treatment of acute conditions alongside their pre-existing comorbidities.

You can select from a range of common, high-cost comorbidities to generate an instant treatment plan tailored to the unique needs of the patient.

The tool makes it easy to quickly treat and stabilise patients with comorbidities. This effective management of the patient increases efficiencies and quality of care, ultimately leading to better clinical outcomes, shorter hospital stays and fewer readmissions.

Follow these simple steps to begin

Step 1: Go to **bestpractice.bmj.com** and access via your institution's preferred route. If you are unsure of your institution's access method, please speak to your Librarian. You will know you have accessed successfully when you can see your institution name displayed at the top of the screen.

Step 2: Click on the **'Comorbidities'** icon in the blue navigation bar on the BMJ Best Practice homepage to view a list of all acute topics featuring the Comorbidities tool.

Step 7: The **C+** symbol clearly indicates when a treatment option may be impacted by the comorbidities that have been selected.

Step 8: Expand your chosen treatment option to view details on how the treatment has been adjusted for the comorbidity. This is presented in a way that is realistic for daily practice. The recommendations given are based on evidence, or expert opinion where evidence is scarce or equivocal.
